on Mar 2, 2001 this sequence version replaced gi:13160313.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone, as we submit sequences under together with a note of the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either dubble-stranded or sequencing problems, such chemistry or covered by high quality data (i.e., phred quality > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subbclone or more than one Mi3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em; EMBL; Sw; SMISSPROT; Tr:, TREMBL; Wp:, WORMDEP; Information on the WORMPEP database can be found at their subcome X. Constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/ChxX
RP13-77011 is from the library RP01-131. constructed by the group of Pieter de Jong. For further dispanse changer is sequenced by the sanger of clone RP13-77011 The true wis sequenced by the sanger of clone and be found at the sequence of the partire insert of clone contigs of human while sequenced by the partire insert of clone RP13-77011 The true
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is the entire insert of clone RP13-77011 The true left end of clone RP13-97115 is at 15298 in this sequence. The true right end of clone RP13-97115 is at 131153 in this sequence. Location/Qualifiers

On May 15, 2001 this sequence version replaced gl:8705130

gi:13785125.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations to the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only as small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1:e., phred quality) an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the

                                                                                                                            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGPC/ArxX RPI1-2613 is from the library RPC1-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
VECTOR: pBA.Ce3.6 sequence is not the entire insert of clone RPI1-26613 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlapp.
The true left end of clone RPI1-382F24 is at 129906 in this sequence. The true right end of clone RPI1-386721 is at 100 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             note="Alusc repeat: matches 1. .30b of consensus" (note="Alusc repeat: matches 1. .299 of consensus" (note="Alusx repeat: matches 127. .214 of consensus" (note="Min repeat: matches 127. .214 of consensus" (note="Min repeat: matches 418. .390 of consensus" (note="Lima" repeat: matches 4980. .6284 of consensus" (note="Lima" repeat: matches 5963. .6153 of consensus" (note="Lima" repeat: matches 1626. .6308 of consensus" (note="Lima" repeat: matches 1626. .6308 of consensus" (note="Lima" repeat: matches 1626. .6308 of consensus" (note="Lima" repeat: matches 979. .1626 of consensus" (note="Lima" repeat: matches 6. .6143 of consensus" (note="Lima" repeat: matches 6. .6143 of consensus" (note="Lima" repeat: matches 4619. .4658 of consensus" (note="Lima" repeat: matches 4619. .4658 of consensus" (note="Lima" repeat: matches 2. .231 of consensus" (note="Lima" repeat: matches 2. .231 of consensus" (note="Lima" repeat: matches 198. .625 of consensus" (note="Lima" repeat: matches 389. .311 of consensus" (note="Lima" repeat: matches 2530. .3291 of consensus" (note="L
absembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at

Direct Submission

No Direct Submission

Submitted (11-JAN-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 iSA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Jan 13, 2001 this sequence version replaced gi:12044561.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AL158819 174913 bp DNA linear PRI 11-JAN-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          repeat_region
                                                                                                                                             repeat_region
                                                                                                                                                                                                                repeat_region
annotated repeat sequence elements. Where the sequence is annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: Ems.; Emsl. Sw.; SWISSPROT: Tr.; TREMBL; Wp.; WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial chone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/ChrX RPI1-382F24 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. Non Nov 1, 2001 this sequence version replaced gil.16214004.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone amen. Not: that the variation annotation may not be found in the sequence sibmission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw.,

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           * NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequencing vector: M13; 84% Sequencing vector: plasmid; 16% Chemistry: Dye-trimer ET; 0% of reads Chemistry: Dye-trimer ET; 0% of reads Chemistry: Dye-triminator Big Dye: 100% of reads Assembly program: Phrap; version 0.990319 Consensus quality; 219149 bases at least Q40 Consensus quality: 21946 bases at least Q20 Insert size: 90u1; agarose-fp Insert size: 90u1; agarose-fp Insert size: 222055; sum-of-contigs Quality coverage: 13.57 in Q20 bases; sum-of-contigs Quality coverage: 13.91 in Q20 bases; sum-of-contigs

Green, or moningson), and available information.

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is not the entire insert of clone C33G3. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone C33G3 is at 1 in this sequence. The true left end of clone F16B12 is at 33555 in this sequence. The true left end of clone F16B12 is at 33555 in this sequence. The true right end of clone C04C11 is at 3475 in this sequence. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         join(3893. .4063,5154. .5198,5368. .5434,5705. .5850,

Homo sapiens chromosome 19 clone RP11-393E18, WORKING DRAFT SEQUENCE, 30 unordered pieces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOTE: This is a 'working draft' sequence. It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                           Center: Washington University Genome Sequencing Center
